Application for Senior Frontend Engineer

Dear Hiring Team,

Your Senior Frontend Engineer opening at Example AG focuses on React, frontend architecture, and close work with product and platform teams in Zurich. That combination is what prompted me to apply.

At Unique AG I led frontend engineering for an agentic AI chat platform in financial services, with RAG and MCP integrations for context-aware, compliant client interactions. At SAP I was technical lead on Field Service Management's move to microfrontends and, after promotion to Associate Development Architect, co-designed the FSM protocol for secure third-party integrations.

I would bring the same end-to-end ownership to Example AG: shipping React and TypeScript UIs, aligning teams on shared frontend foundations, and delivering with tests and CI/CD. I am currently building Shellui, an opinionated microfrontend shell (TypeScript, React, Django), and previously took FromEdwin.com from idea to production as a solo founder.

I would welcome a conversation about how this background can support your Senior Frontend Engineer goals at Example AG. Thank you for considering my application.

Kind regards,

Sébastien Barbier
