Application for Senior Frontend Engineer

Dear Hiring Team,

The Senior Frontend Engineer opening at Example AG describes React and TypeScript ownership across several customer-facing apps, with shared frontend architecture and close work with product and platform teams. That scope matches the frontend and microfrontend work I have delivered in regulated product environments.

At Unique AG I led frontend engineering for an agentic AI chat platform serving financial services, including RAG and MCP integrations for context-aware, compliant client interactions. At SAP, on Field Service Management, I was technical lead for the move to microfrontends and, after promotion to Associate Development Architect, co-designed the FSM protocol for secure third-party integrations while mentoring developers on the program.

For Example AG, I would apply the same approach: React and TypeScript delivery, clear architecture across teams, and releases backed by automated tests and CI/CD. I am building Shellui, an opinionated microfrontend shell (TypeScript, React, Django), maintain 1,000+ tests on that codebase, and have shipped solo products such as FromEdwin.com from architecture through production.

I would welcome a conversation with you about this Senior Frontend Engineer position and how my experience can support Example AG's frontend goals.

Kind regards,

Sébastien Barbier
