Application for Senior Frontend Engineer

Dear Hiring Team,

I am applying for the Senior Frontend Engineer position at Example AG. I am drawn to product-focused engineering teams that treat frontend architecture as a first-class concern, and I am looking for a role where I can contribute both hands-on implementation and technical direction. My background combines frontend leadership, distributed systems, and end-to-end product development.

At Unique, I led frontend engineering for an agentic AI chat platform in financial services, using RAG and MCP to support context-aware, compliant client interactions. Previously at SAP, I helped design a distributed extensibility protocol for secure third-party integrations and supported Field Service Management's migration to a microfrontend architecture. These experiences map well to roles that need strong React expertise, system design judgment, and clear collaboration with product and platform teams.

Alongside these roles, I have built and operated independent products end to end, most recently Shellui, an open-source web app platform. That habit of owning architecture through delivery is what I would bring to Example AG as a Senior Frontend Engineer.

I would welcome the opportunity to discuss how my experience could support your frontend and platform goals. Thank you for considering my application.

Kind regards,

Sébastien Barbier
